It is important to mention that Fargate comes with a few limitations. Most applications are not affected by those limitations, but you should double-check before starting with Fargate. A list of the most important—but not all—limitations follows. See “Amazon ECS on AWS Fargate” at http://mng.bz/19Wn for more details:

- A maximum of 16 vCPU and 120 GB memory.
- Container cannot run in `privileged` mode.
- Missing GPU support.
- Attaching EBS volumes is not supported.

Now it’s finally time to see ECS in action.

18.5 Walking through a cloud-native architecture: ECS, Fargate, and S3

We take notes all the time: when we’re on the phone with a customer, when we’re thinking through a new chapter for a book, when we’re looking at a new AWS service in detail. Do you do this too? Imagine you want to host your notes in the cloud. In this example, you will deploy Notea, a privacy-first, open source note-taking application to AWS. Notea is a typical modern web application that uses React for the user interface and Next.js for the backend. All data is stored on S3.

The cloud-native architecture, as shown in figure 18.6, consists of the following building blocks:
