⑦ A simple way to scale ECS services is by using target-tracking scaling, which requires minimal configuration.

⑧ References the scalable target resource from above

⑨ The target is to keep the CPU utilization at 50%. You might want to increase that to 70–80% in real-world scenarios.

⑩ After terminating tasks, waits three minutes before reevaluating the situation

After starting tasks, waits one minute before reevaluating the situation

In this example, we scale based on CPU utilization. ECSServiceAverageMemoryUtilization is another predefined metric.

That's it, you have learned how to deploy a modern web application on ECS and Fargate.

Don't forget to delete the CloudFormation stack and all data on S3, as shown in the following code snippet. Replace `$ApplicationId` with a unique character sequence you chose when creating the stack:

```
$ aws s3 rm s3://awsinaction-notea-${ApplicationID} --recursive
$ aws cloudformation delete-stack --stack-name notea
$ aws cloudformation wait stack-delete-complete \
➥ --stack-name notea
```

What a ride! You have come a long way from AWS basics, to advanced cloud architecture principles, to modern containerized architectures. Now only one thing remains to be said: go build!

Summary

- App Runner is the simplest way to run containers on AWS. However, to achieve simplicity, App Runner comes with limitations. For example, the containers aren't running in your VPC.
