THERE ARE MORE THAN **1 BILLION BICYCLES** IN THE WORLD, WITH **UP TO 100 MILLION ADDED** EVERY YEAR

WHICH PLANE IS THE WORLD'S MOST POPULAR AIRLINER?

The Boeing 737, first manufactured in 1967, is the most popular airliner, with more than 10,000 built.

Gas power

Most transportation technology relies on one simple scientific principle—gas expands when it is heated. Gasoline, diesel, turbine, and rocket engines are all activated by expanding gas. When gas expands inside an engine, it does so with great force that can be used to turn wheels or propellers or produce a powerful jet. Most often the gas involved is air. Burning fuel usually provides the heat to make the air expand, but other energy sources are sometimes used. Some warships, submarines, and ice breakers are nuclear-powered. They use the heat produced by radioactive elements such as uranium to generate the expanding gas that powers their propellers.
