that information on explosive devices around and near the village was shared between and among villagers, the Myanmar military, EAGs, and other parties using 'business mines' in person (MRE WG 2014). But such information is shared not necessarily to prevent harm, but rather as a warning not to go near areas under the control of whoever is using landmines.

Information is not often shared using signage. According to the MRE WG (2014) data, just over one percent of respondents would set a 'warning sign' if they saw an explosive device. Of forty-five interviews with landmine survivors or their families, thirty-seven stated that the area where the accident occurred was not marked as dangerous.

Norms for landmine use partly depend on myths. For example, numerous informants mentioned that homemade devices made from bamboo only last one rainy season or six months. In fact, it is difficult to know the durability of these devices because testing the reliability of a homemade device after a rainy season is not something to be encouraged. In any event, the combination of myths with norms of landmine use presents a considerable challenge to anyone seeking to implement risk education interventions with populations actively engaging with explosive devices.

FINDING A WAY FORWARD

This concluding section presents two approaches to responding to the use of landmines in Myanmar. It directs action in terms of how international organizations and actors operating outside conflict areas can best engage with communities to have more impact for the safety of populations, retain local agency, and create more opportunity for local voices in nascent political dialogue in these areas. One intervention operates at a community level, while the second focuses on sub-national and joint state administration.

When asked about the best way to inform people about how to keep safe around explosive devices, the majority of respondents (thirty-six per cent) stated that people should organize themselves (MRE WG 2014). As one said, "Fitting in with local contexts is the best, and if people can organize themselves, it's perfect."[18]

A community-based participatory systems model of conflict dynamics is one method that can promote village agency to deal with landmines (Jolliffe 2015). Such an approach can lead to a better understanding of
