identify the underlying gendered drivers of conflict, in order to envision strategies for how to end it (see Pugh, Goodhand, and Cooper 2004).

Table 4.1. Female representation in local- and national-level governance, 2014

Body	% women	no. of women	total no.
Lower House (MPs & military appointees)	5.79	25	432
Upper House (MPs & military appointees)	1.79	4	224
Upper and Lower House (MPs & military appointees)	4.42	29	656
State and Region (MPs)	2.83	25	883
State and Region (Ministers)	2,37	4	169
Townships Administrators	0	0	330
Ward/Village Tract Administrators	0,11	19	16,743

This chapter begins with a brief overview of the literature on Myanmar and civil war, noting an absence of gender analysis of war and insecurity. I will here argue that the lack of scholarly attention to the relationship between gender, minority communities, and conflict limits our understanding of the gendered drivers of conflict and therefore also limits possible solutions to it. I will then define feminist political economy, showing how a gendered analysis of the division of labour from the level of the household to the level of the state produces the setting for Kachin women's support of and participation in political violence. Here I will outline a method drawing on the work of Jacqui True (2010, 2012), and apply it to the conflict in Kachin State, through analysis of the divisions of labour at the level of the family, the army, and the community, political marginalization on a national and local scale, and socio-economic inequality. This method will allow me to link different levels of political economy that impact gendered insecurity, and explore the relationship between political violence and experiences of gendered insecurity. Throughout this section, this method will be employed to analyse women's motivations to participate in and support political violence in Kachin State, showing the connection between gendered experiences of insecurity and armed conflict.
