Dragonwing edge processors

Qualcomm has introduced the Dragonwing Q-2390 and IQ-2390 edge processors for devices needing local AI, vision, connectivity, and real-time computing. The Q-2390 integrates application processing, AI, graphics, camera/display, location, security, and I/O for smart-home, retail, and enterprise IoT. The IQ-2390 adds AI acceleration, machine vision, deterministic networking, and real-time processing for industrial automation and building management.

Multiaxial coreless Hall-effect current sensor

Texas Instruments has introduced the TMCS2100-Q1, a multiaxial coreless Hall-effect current sensor for HEV and EV traction inverters. It measures magnetic fields across horizontal and vertical axes simultaneously, using an algorithm to compensate for errors from mechanical displacement and vibration. The coreless architecture needs no busbar modifications, supporting compact, power-dense inverters. With up to 20x higher accuracy than single-axis sensors, it enhances motor torque control and reduces torque ripple.

650V IGBTs

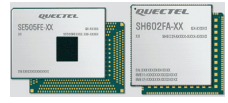

ROHM has introduced its 4th-generation 650V IGBTs for automotive electric compressors, high-voltage heaters, and industrial motor/compressor inverters. A redesigned semiconductor structure and edge termination increase current density while reducing conduction and switching losses. Compliant with AEC-Q101, the IGBTs target compact power systems needing energy efficiency, thermal performance, and overcurrent protection.

4G and 5G smart modules

Quectel has introduced the SH602FA and SE505FE smart modules, bringing Android 16, cellular connectivity, processing, graphics, and multimedia to compact IoT platforms. The 4G SH602FA supports cameras up to 64MP, targeting handheld terminals, smart intercoms, inspection equipment, and safety devices without an external host processor. The 5G SE505FE integrates 5G/LTE, Wi-Fi 6, GNSS, and cameras up to 32MP, suiting robotics, digital signage, video systems, and smart gateways.

Smartphone processor

Xiaomi has unveiled its Xring O3 smartphone processor, advancing its in-house silicon programme and strengthening control over mobile hardware. Reportedly fabricated by TSMC on a 3nm process, the chip is expected to deliver higher transistor density and power efficiency for demanding workloads. It may power an upcoming foldable smartphone, per Reuters. It follows Xiaomi's first proprietary processor, the Xring O1, enabling tighter hardware-software integration and less dependence on external suppliers.

Aerospace proximity sensors

Honeywell's GAPS and HAPS aerospace proximity sensors are available through Powell Electronics for aerospace, defence, and industrial systems. The configurable, non-contact sensors use eddy current killed oscillator (ECKO) sensing with patented fixed amplitude variable current oscillator (FAVCO) technology to detect target presence while monitoring sensor health. An optional health output flags internal faults, helping systems distinguish real position changes from sensor failures. Hermetically sealed construction supports demanding environments, with HAPS built for harsher aircraft conditions than GAPS.

Six-core, twelve-thread processors

AMD has expanded its desktop portfolio with the Ryzen 5 7500 and Ryzen 5 5500F, spanning its AM5 and established AM4 platforms. Both six-core, 12-thread processors support 65W operation for mainstream computing and gaming. The Zen 4-based Ryzen 5 7500 adds DDR5, PCIe 5.0, and integrated Radeon graphics, while the Zen 3-based Ryzen 5 5500F supports DDR4 and requires a discrete GPU, targeting new gaming PCs and affordable AM4 upgrades.

DC/DC power modules

Rajguru Electronics' K78xx-500R3 series DC/DC power modules provide compact, non-isolated voltage conversion for industrial, automotive,
