communications, IoT, and rail electronics. Available in positive and negative output variants, the modules support multiple regulated voltage rails with efficiency reaching 95 per cent. Their SIP-3 package simplifies board integration where space is limited, while short-circuit protection and low ripple ensure reliable power delivery across embedded controllers, industrial control systems, and communication equipment.

Bluetooth Low Energy module

KAGA FEI's ES4L15MA1 Bluetooth Low Energy module simplifies wireless integration in compact IoT devices by shipping with pre-loaded firmware. Built around Nordic Semiconductor's nRF54L15 wireless microcontroller, the rice-grain-sized module lets a host processor control Bluetooth functions via universal asynchronous receiver-transmitter (UART) commands, reducing application firmware development. It supports central and peripheral roles, custom generic attribute profile (GATT) services, over-the-air updates, and low-power modes, targeting smart locks, lighting, wearables, and fitness trackers.

Ultra-low-power IC

Nanopower Semiconductor's nPZ2100 ultra-low-power IC extends battery life in edge and IoT devices by handling routine sensor monitoring without repeatedly waking the main MCU. Part of the nPZero platform, it manages up to six peripherals via I²C or SPI and can selectively power peripheral and host domains. Its local processing and event-detection enable a 'sense, decide, wake, process' architecture, targeting wireless sensors, smart-home products, asset trackers, and industrial monitoring equipment.

EMBEDDED

Smart mobility architecture system-on-module

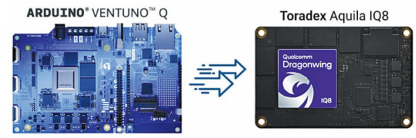

MYIR Electronics has introduced the MYC-JMX95X smart mobility architecture (SMARC) system-on-module, bringing AI processing, real-time control, camera connectivity, networking, and security to embedded devices. Based on the NXP i.MX95 processor, it combines Arm Cortex-A55 processing with dedicated real-time and security cores, an NPU, and a GPU. It supports machine vision, multi-display systems, industrial automation, edge AI gateways, and in-vehicle infotainment, with camera, CAN FD, UART, SPI, I2C, and networking interfaces plus TrustZone, Secure Boot, and post-quantum-ready security.

Aquila IQ8 system-on-module

Toradex has introduced the Aquila IQ8 system-on-module, powered by the Qualcomm Dragonwing IQ-8275 processor for AI-intensive industrial applications. It combines an eight-core Kryo CPU, Adreno GPU, and a dedicated Hexagon NPU delivering up to 40 Dense TOPS for local AI inference without continuous cloud connectivity. Its multi-camera support targets robotics, machine vision, and industrial automation. The rugged 400-pin architecture simplifies carrier-board integration, while Toradex's Torizon Linux platform supports secure updates and device management.

Small fanless edge AI computer

IBASE Technology has introduced the AA400-N, a compact fanless edge AI computer for machine vision, robotic vision, autonomous inspection, and industrial automation. Powered by AMD Ryzen Embedded 8000 series processors, it combines CPU, GPU, and NPU processing for up to 39 TOPS of on-device AI workloads. It supports dual-channel DDR5 memory, 8K-capable DisplayPort 2.1/HDMI 2.1 outputs, NVMe storage, and optional 5G/LTE or Wi-Fi, with 2.5GbE LAN, USB, and COM ports for space-constrained installations.

Compact evaluation board

BrainChip and Neuromorphyx have introduced the BrainBoard1500, a compact evaluation board built around the AKD1500 neural-network accelerator for low-power embedded AI development. Designed in the Arduino Nicla form factor, it lets developers evaluate spiking neural networks using direct sensor data through SPI/QSPI, with I2C for control and onboard flash for model storage. An integrated two-channel current monitor measures inference power consumption, targeting battery-powered applications like keyword spotting and visual wake words.

Single-board computer

ArmSoM has introduced the Sige6, a compact single-board computer powered by the Allwinner A733
