octa-core SoC for Linux- and Android-based embedded applications. The board combines up to 16GB LPDDR5

memory, soldered eMMC storage, NVMe expansion, and a 3-TOPS NPU for local AI workloads. Connectivity includes gigabit Ethernet, Wi-Fi 6, Bluetooth 5.4, HDMI 2.0, MIPI CSI, and a 40-pin Raspberry Pi-compatible GPIO header, suiting edge AI, smart displays, and robotics.

Made-in-India Wi-Fi module

IndieSemiC has launched the ISC-8188-B, a made-in-India Wi-Fi module designed for IP cameras, CCTV systems, smart doorbells, and connected vision devices. The module works as a

USB-to-Wi-Fi bridge, letting manufacturers add wireless connectivity through a standard USB 2.0 interface without redesigning core hardware. Supporting integrated or external antennae and having built-in security, it simplifies production integration and complies with standardisation testing and quality control (STQC) requirements, serving wireless video transmission, smart surveillance, and home security applications.

MANUFACTURING EQUIPMENT & MATERIALS

Automated X-ray system for large PCBs

SAKI Corporation has launched the 3Xi-ZS1EX automated X-ray inspection system for large PCBs used in data centre and AI server applications. It combines 3D X-ray computed tomography with AI-based image analysis to

inspect warpage, tall components, hidden defects, and voids. Automatic warpage correction maintains accuracy across large boards, while high-resolution imaging supports complex assemblies and press-fit connections. AI-based void detection reduces image noise, and the compact platform offers 1.6x faster throughput, making it suitable for high-volume electronics manufacturing.

Automated optical inspection system for PCBs

Mek (Marantz Electronics) has introduced the redesigned PowerSpector JSAz 350 desktop automated optical inspection (AOI) system for stable PCB inspection on space-constrained

SMT and THT production lines. Its fixed PCB stage improves mechanical stability, while Selective 3D Laser Measurement enables repeatable component-height inspection, defect detection, and placement checks. The compact chassis offers a cost-effective alternative to larger platforms. Multi-angle LED and diffused on-axis light (DOAL) illumination with configurable cameras (up to nine) support multi-directional inspection, and Catch System integration adds traceability.

Pick-and-place machine for low-volume manufacturing

Fuji Corporation has developed the CLT-FG SMT pick-and-place machine for high-mix, low-volume electronics manufacturing where flexibility

and floor space are critical. Its compact design suits restricted production areas, while a versatile placement head handles both small chip components and larger devices. The machine suits lines requiring frequent changeovers, diverse PCB assemblies, and fluctuating volumes. A streamlined configuration simplifies installation and line planning, while compatibility with existing equipment supports easier integration and greater flexibility.

4K digital microscope

Vision Engineering has introduced the EVO Cam AURA digital microscope platform for industrial inspec-

tion, quality control, and laboratory applications. Its 4K imaging reveals cracks, contamination, solder joints, and pad geometry, while autofocus, focus stacking, optical zoom, and interchangeable optics support uneven, complex surfaces. The AURA software integrates imaging, measurement, analysis, and reporting. Supervisor mode locks critical parameters for production consistency, while annotations, measurements, and timestamps
