Tata Electronics will combine fabless chip design with semiconductor fabrication, packaging, and testing, targeting automotive, industrial, communications, security, and intelligent-edge applications. The deal will explore design-to-fabrication optimisation, packaging technologies, manufacturing processes, and quality systems across Tata's India facilities.

Tata Electronics, Sumitomo Chemical sign MoU to strengthen semiconductor supply chain

Tata Electronics and Sumitomo Chemical will explore supplying photoresists and functional chemicals to Tata's upcoming 300mm Dholera fab in Gujarat, and examine manufacturing semiconductor materials and high-purity chemicals in India. The $11 billion fab is expected to serve automotive, mobile, and AI applications.

ASML begins India operations to support Tata's flagship semiconductor fab

ASML has begun India operations, initially hiring 20 to 30 engineering graduates, to support Tata Electronics' semiconductor expansion. Tata Electronics is ASML's primary customer as it develops a 300mm Dholera fab designed for 50,000 wafers monthly from 2028. ASML has no concrete local manufacturing plans.

Lam Research to invest $1.2bn in first Indian silicon production plant

Lam Research plans to invest nearly $1.2 billion to establish its first silicon component manufacturing facility and expand R&D. The plant will span silicon ingot production and processing in a vertically integrated setup. The company will build engineering capabilities alongside programmes with the Indian Institute of Science (IISc) and the India Semiconductor Mission.

India's fabless chip design reaches first silicon with MuDRA-1

Morphing Machines has taped out MuDRA-1, its India-designed chip, marking its transition from architecture and design to silicon. Showcased at SEMICON India 2026, the chip is headed for packaging and bring-up after fabrication, with plans to scale toward advanced nodes, systems, and frontier AI inference applications.

India's first broadband chip moves towards commercialisation

Aheesa Digital Innovations has completed first-pass silicon validation for Vihaan-I, an indigenous broadband networking SoC targeting commercialisation in early 2027. The chip uses reduced instruction set computer-five (RISC-V) with the Centre for Development of Advanced Computing's (C-DAC's) VEGA processor. Aheesa has signed packaging and distribution partnerships, currently manufacturing via UMC.

Aheesa presents Vihaan-I Semicon chip to Union Minister Ashwini Vaishnaw at Semicon India 2026

HCLTech opens $19.5M Bengaluru semiconductor testing facility

HCLTech has opened a ₹1.85 billion ($19.5 million) testing facility in Bengaluru, with 3716 square metres (40,000 square feet), including Class 10K and 1K cleanrooms. It offers post-silicon services, electrical testing, qualification, and failure analysis, using equipment from Teradyne, Advantest, Keysight, Tektronix, and Thermo Fisher.

Odisha secures major semiconductor investments under India's ISM 2.0

Odisha has approved five semiconductor projects worth $1.14 billion, creating 4500 direct and 16,000-plus indirect jobs, spanning SiC manufacturing, glass substrates, packaging, memory, and power electronics for EVs, railways, defence, and energy, via SiCSem, RIR Power Electronics, HIPS/3DGS, Sancode, and ASP Semicon.

IndieSemiC and Kaynes Semicon partner to boost domestic chip manufacturing

IndieSemiC and Kaynes Semicon will establish a local outsourced semiconductor assembly and test (OSAT) framework covering qualification,
