

Ground breaking ceremony of ASIP Technologies in Visakhapatnam

another three months. After that, we will undertake volume-production qualification and certification, which could take another three months. Overall, the timeline could range from 12 to 15 months, with the best-case scenario being around 12 to 13 months. Our target is to enter volume production by Q4 2027.

Who are likely to be the first customers for the facility?

In the semiconductor industry, customer names are generally confidential, so we cannot disclose them. However, ASIP Technologies is a joint venture with an established Korean OSAT company, which has agreed to take at least 50 per cent of the capacity of the new plant. We are also in active discussions with two to three other customers who are interested in using capacity from the facility.

What are the most technically challenging processes that ASIP Technologies expects to establish locally?

One of the biggest challenges will be developing the right workforce and establishing the manufacturing discipline required to operate the facility at high efficiency and with low defect density. The initial workforce can be trained in the technical aspects of the job, but running a semiconductor manufacturing facility requires a high level of discipline, consistency, and attention to detail.

What are the biggest gaps in India's domestic OSAT ecosystem today?

The biggest gap is trained talent, particularly people who understand semiconductor packaging and testing technology, and know how to operate a factory at very high efficiency. There is also a shortage of experienced semiconductor manufacturing leadership in India. We are looking at bringing in some senior leadership from Asia or Korea to help establish the factory and reach the required efficiency levels during the first one to two years.

What is your larger vision for ASIP Technologies once the Visakhapatnam facility becomes operational?

Our immediate objective is to establish the facility, achieve stable production, deliver consistent quality to customers, and become profitable. Once we have successfully established the first phase, our focus will shift towards Phase 2 and more advanced packaging technologies such as 2.5D packaging. Our long-term objective is to build a globally competitive semiconductor manufacturing company in India that can serve customers not only in India but across the global semiconductor ecosystem. EFY
