THE DASHBOARD

India's Semiconductor Demand To Cross $90B By FY2030, New Report At SEMICON India 2026

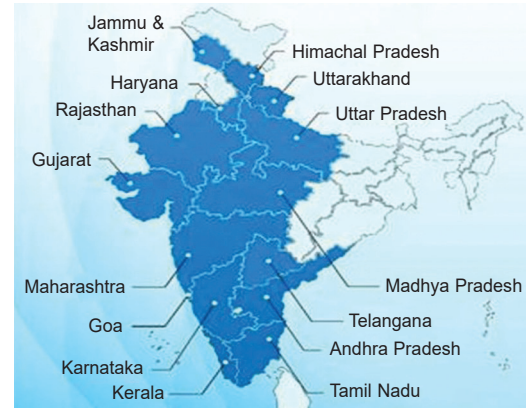

India's semiconductor demand is projected to rise from about $44 billion in FY2025-26 to $90 billion by FY2029-30. Mobile and wearables are expected to account for about $42.13 billion. Mobile handsets, computing products, and industrial equipment currently drive around 70% of local consumption, while automotive electronics, green power systems, and telecom hardware are seeing faster adoption. Semicon 2.0, with a ₹1.275 trillion outlay, prioritises silicon wafer fabs.

Segments	2029-30, USD Bn	Drivers
Mobile and wearables	42.13	Government push through PLIs, rising need for connectivity and higher penetration of smartphones
Telecom	13.22	5G rollouts and government push through PLI schemes
Information technology	11.31	Increased emphasis on data localisation and increased adoption of cloud usage
Industrial	7.95	Technology modernisation and proliferation of AI, digital and connected technologies
Consumer electronics	5.55	Increased disposable income with middle-class
Automotive	4.52	Further expansion in ADAS and EV penetration
Strategic sectors	2.19	Defence modernisation and localisation initiatives to fuel demand

ECMS Outlay Reaches ₹400 Billion As Approved Investment Hits ₹695.48 Billion

India's Electronics Components Manufacturing Scheme (ECMS) outlay has reached ₹400 billion, up from ₹229.19 billion. As of Q3 2026, 106 projects across 15 states covering 30 electronic-domain products had secured approval, involving ₹695.48 billion in investment. The projects account for ₹5.34 lakh crore (5340 billion) in projected production, 74,628 direct jobs, and 250,000 indirect jobs. Meanwhile, component and sub-assembly demand is expected to reach US$240 billion by 2030, with priority components and sub-assemblies reaching US$139 billion at a 30% CAGR.

India Smartphone Market Leans Towards Premium And Foldables

India's smartphone shipments fell 10% YoY in Q2 2026, with the sub-₹15,000 segment declining 45%. The market is increasingly shifting towards higher-value devices: global average selling price (ASP) is projected to rise 22% to $450 in 2026. In India, the premium segment remains more resilient, while cumulative foldable smartphone shipments are expected to cross 3 million units by year-end, growing 8% YoY after nearly 80% CAGR since 2019. Foldable ASPs are expected at around $1,800 (~₹170,000), nearly five times India's overall smartphone ASP.

India Smartphone Market Volume Share, Q2 2026 vs Q2 2025

Automotive And EV Power Electronics: Rising To ₹434.9 Billion By 2030

India's broader automotive semiconductor market is projected to grow from ₹199.95 billion in 2024 to ₹434.9 billion by 2030 at a 15.42% CAGR. Within this broader market, India's EV semiconductor market is forecast to expand from $130 million in 2025 to $550 million by 2030 at a 23% CAGR, versus 9.1% globally. EV semiconductor demand is supported by rising EV production, government incentives, manufacturing infrastructure, and localisation, with applications spanning BMS, power management, motor control, MCUs, sensors, power ICs/modules, gate-driver ICs, and wide-bandgap semiconductors.
