

Driving seat
The driver sat with the hull gunner squeezed in to his right. The interior of the tank was cramped and made no concessions to the crew members' comfort.

Gun sight
While aiming the main gun *(left)* the gunner pressed his head on the rubber guard above the optical sight. He could fire the gun by pulling the red wooden toggle on the right.

Cleaning can
A can containing cleaning fluid for the gun was kept inside the vehicle.

Ammo drums
Ammunition for the gunner's coaxial machine-gun lay ready to hand *(above)*. The coaxial gun was usually loaded with tracer rounds, often fired as range finders for the main gun.

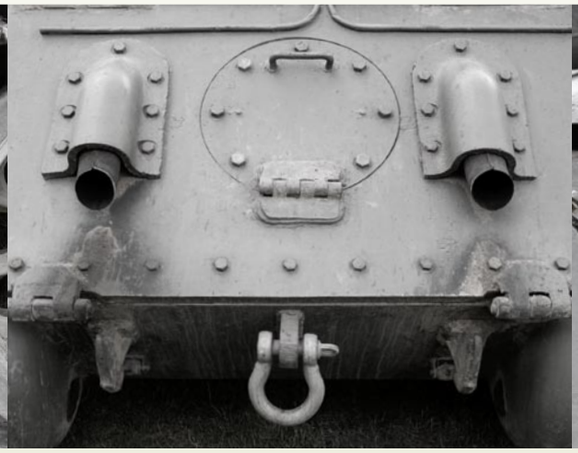

Loader's seat
The loader sat on a detachable seat that was suspended from the inside of the turret and the gun. It was a precarious perch, since the seat would twist as the gun traversed.

Troop carrier
Soviet infantrymen ride into battle on the back of a T-34/85. The hole for the tank's coaxial gun can just be seen on the right-hand side of the turret, beside the main gun.

Back view
At the back of the tank, a hatch between the exhaust pipes gave access to the starter motor. The exhausts tended to emit impressive clouds of smoke, especially when starting up.

Extra fuel
Three drums containing spare diesel fuel were carried on the outside of the tank. They obviously constituted a fire hazard, but were usually empty when entering combat.

Spare track
Spare pieces of caterpillar track were carried in case repairs to the running gear were needed. Hooked onto the turret, they also provided extra protection against enemy fire.
