in deciding the outcome of the interplay of these factors. The other things do not have a significant influence but at the same time they cannot be ignored. The second reason for assumption is to simplify the study and build a base theory, based on which a further complicated study can be done by considering all other factors that have impact or influence on the issue under consideration. The assumption of other variables being unchanged is called *Ceteris paribus*. *The Economic Times* defines *Ceteris paribus* as "This commonly-used phrase stands for 'all other things being unchanged or constant'. It is used in conomics to rule out the possibility of 'other' factors changing, i.e. the specific causal relation between two variables is focused."[2]

In the way in which the laboratory-checked cars and seeds yield less on the field, the economic theories also deliver less in practice as the world is more complicated than what was considered while building economic theories and models. But these economic theories and models do not fail the world as due care is taken while building them and framing them to make them as close as possible to the realities of the world.

Two Main Streams

There are two main streams of Economics. They are Microeconomics and Macroeconomics.

The term 'Micro' is used to indicate something relating to a specific area, rather a general one. The term 'Macro' is used to denote something relating to a general area rather than being detailed or specific. Likewise, Microeconomics studies the specific area of Economics such as individuals, a smaller group like labourers, economics of a firm etc. Macroeconomics studies the economy of a nation as a whole.

The study of demand of individuals, the production function of a
