William J. Sutherland

William (Bill) Sutherland, born in 1956, is a pioneering conservation scientist. His work spans many aspects of conservation, but his key focus is the sharing and embedding of evidence in decision-making. After studying and teaching at both the University of East Anglia and Liverpool Polytechnic, in 2006 he moved to Cambridge, where he is now Director of Research at the university's Department of Zoology.

In the early 2000s, Sutherland established Conservation Evidence, an open-information resource to summarize scientific evidence on conservation action, which can be used to guide practitioner and policy decisions. He also leads an annual project to identify emerging issues of global concern for conservation. His world-leading work on conservation science has been recognized with many awards and honors.

Key works

2022 *Transforming Conservation: A Practical Guide to Evidence and Decision Making*

2009+ Annual horizon scan of global biological conservation/biological issues
