advantage of their international circumstances. It is worth recalling examples, both from India's own experience and that of others, of countries leveraging international relations to improve their own domestic trajectories.

Education and agriculture offer some early examples from newly independent India. For example, the Indian Institutes of Technology (IITs)—now the pride of many Indians—were developed with considerable international support, including from the United States, United Kingdom, Germany, Soviet Union, and United Nations. Similarly, the Green Revolution was helped considerably by American technology on wheat strains and their application in Mexico, as well as funding from private US entities. Despite these early successes, higher education and agriculture have been two areas where India has been more wary about leveraging international resources in recent decades.

There are further examples in Indian public health. Even as India's per capita incomes in the early 2000s were a century behind the West's, its public health indicators were only a half century behind. In fact, rising living standards accounted for only about a quarter of the increase in life expectancy between the 1930s and 1960s. [16] Instead, India—along with other developing countries—benefited from the spread of medical research, public health expenditure and awareness, vaccinations, improved water supply, better sanitation, pest eradication, and other steps to stop the spread of communicable and non-communicable diseases. Although much of the credit for these improvements goes to domestic health professionals and policymakers, India would not have made such swift strides without, for example, assistance from multilateral bodies such as the World Health Organization (WHO) in eradicating polio or private foundations' efforts to improve immunization and counter elephantiasis. Similarly, India's telecommunications revolution—now spearheaded by Indian companies such as Airtel and Reliance Jio—was initially made possible due to the use of equipment from the likes of Ericsson and Nokia, and the outsourcing of information technology services to companies like IBM. Entering the Indian market successfully required these corporations to depart from some
